Contextual Design of Interactive Systems

medieninformatik

IMAI – Institut für
Mathematik und
Angewandte Informatik

Does good design pay?

A simple premise: If we design and develop digital products in such a way that the people who use them can easily achieve their goals, they will be satisfied, effective, and happy. They will gladly pay for our products—and recommend that others do the same. Assuming that we can do so in a cost-effective manner, this will translate into business success. (Cooper et al., 2014)

Does it? What do you think?

IF SOMETHING IS FORMATTED LIKE A SERIOUS SCIENTIFIC PAPER, IT CAN TAKE ME A WHILE TO REALIZE IT ISN'T ONE.

👉 xkcd: dubious study

Skim & Read

■ Do not read from start to finish

- 1 Abstract
- 2 Conclusions
- 3 Introduction
- 4 “the rest”

■ Whether you continue with the conclusions or the introduction depends on your familiarity with the topics...and on the length of the sections

calamitiesofnature.com © 2012 Tony Piro

☞ Calamities of Nature

Skim, Re-Read, Examine, Summarize

- Another approach championed by Natalia Rodriguez
- Four steps
 - Skim
 - Read for “big picture”
 - Re-read
 - Examine graphs, tables, figures
 - Interpret the data yourself
 - Examine
 - What problems are addressed?
 - Why is it important?
 - Is the method good?
 - Summarize
 - Write a summary of key point in own words
-  Elsevier Connect,  research4life.org

Three Pass Reading

Required
Reading

Week 1

Academic Literacy:
Reading

Introduction

Design
Processes

Linear Models

Iterative
Models

References

■ Read the Paper in three passes

1 Quick scan to get a bird's-eye view of the paper to be able to answer the five C:

- 1 Category: What type of paper is this?
- 2 Context: Which other papers is it related to?
- 3 Correctness: Do the assumptions appear to be valid?
- 4 Contributions: What are the main contributions?
- 5 Clarity: Is the paper well written?

2 Read the paper with greater care, but ignore details such as proofs

- Afterwards, you be able to summarize the main thrust of the paper, with supporting evidence, to someone else

3 Attempt to virtually re-implement the paper

- Making the same assumptions as the authors, try to re-create the work

■ 📌 S. Keshav: How to Read a Paper

What to Look For

Required
Reading

Week 1

Academic Literacy:
Reading

Introduction

Design
Processes

Linear Models

Iterative
Models

References

- Five elements to look out for:
 - 1 A significant question or claim
 - 2 A position in the academic debate
 - 3 An explanation of the research method or approach
 - 4 A presentation of the findings and argument
 - 5 A statement of the implications and contributions of the research study
- You should also aim to place a journal article within the broader academic debate
- 📖 Nicholas Carah and Eric Louw: Guide to reading journal articles

RV Subramanyam

“The reader should begin by reading the title, abstract and conclusions first. If a decision is made to read the entire article, the key elements of the article can be perused in a systematic manner effectively and efficiently. A cogent and organized method is presented to read articles published in scientific journals.”

Subramanyam R V. Art of reading a journal article: Methodically and effectively. *J Oral Maxillofac Pathol [serial online]* 2013; 17:65-70. Available from: <http://www.jomfp.in/text.asp?2013/17/1/65/110733>

Notes & Annotations

■ Annotations

- The paper advantage
- Notes, marks, scribbles, Post-Its are sign of active, creative examination of the content

■ Notes

- Never read a text without pen & paper

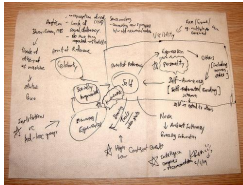

cc by-nc Manuel Sanfuentes

cc by Kristian D.

- Reproducing parts of a text
 - Paraphrased or word-by-word
 - WordNet synonyms: excerpt, excerption, extract, selection
- 1 Orientation
 - Get a grip of the structure of the text
 - 2 Excerpt
 - Work with the text – “what is the contribution of this part of the text?” and “what are the main points made?”
 - 3 Compact
 - Summarize the texts and the excerpts

- Visualisation
 - Mindmaps, Concept Maps, ...
- Individual preferences

- These problems are only “skin deep”
- What about problems that do not manifest themselves in what we see?
- What about problems stemming from the fact that some activity is not supported?
- Common problems: Computers...
 - ...are rude, the user is at fault
 - ...require you to think like a computer, e.g. “Enter SSID”
 - ...are sloppy, e.g. asking you to save a document after you printed it
 - ...require humans to do the heavy lifting, e.g. try to paste formatted text

Mitigation

Introduction

- Development and design of digital media and software applications can become very costly for larger projects
- For small projects with one or few developers, ad-hoc approaches may work
- More extensive productions require communication and coordination
- Classic problem of software development
- Often a mixture of different areas
 - Software design
 - Media design
 - Usability design
 - User experience design
- Focus here
 - Iterative processes
 - Human-centred models

User experience (UX) design has three overlapping concerns
(Cooper et al., 2014)

Definition

Human-oriented design activities include:

- Understanding the desires, needs, motivations, and contexts of people using products
- Understanding business, technical, and domain opportunities, requirements, and constraints
- Using this knowledge as a foundation for plans to create products whose form, content, and behavior are useful, usable, and desirable, as well as economically viable and technically feasible

Learning outcomes

Required
Reading

Introduction

Errors

What do you mean?

Choices

Hardware

Mitigation

Design
Processes

Linear Models

Iterative
Models

References

- Understanding the necessities of design processes
- Specific challenges when developing and designing interactive systems
 - Particularly involving digital media
- Different human-centred processes and their advantages and shortcomings
- Be aware that there are different challenges for
 - Interactive productivity software
 - Games
 - Digital media
- One needs to find a fitting model and then understand how to use it

Design Processes

- The design process should be ...
 - goal-oriented
 - have the desired use, material, cost, usability and user experience in mind
 - should enable creativity
 - include cost and goal planing
 - make decisions traceable
- We also need plans and requirements
 - Where are we?
 - What is missing?
- Flexibility and alternatives should be possible

Usability Engineering

Required
Reading

Introduction

Design
Processes

Linear Models

Iterative
Models

References

- Usability Engineering and user experience design cannot stand on their own
- They need to be connected to software development methodologies
- Different process models and design philosophies are differently suitable
- Mediation between different “stakeholders” is a key issue for usability experts
 - We need to know and understand software engineering processes
 - We need to know and understand artistic and design processes
 - We need to communicate with customers and users

Assignment 2.3: Gadget Design

Group Work

What about a new gadget that includes:

- FM-Radio
- “something with USB”
- CD-Player
- Telephone
- Answering machine
- (Alarm) Clock
- Lamp (night stand or desk)
- Maybe even:
 - TV
 - “Smart features” (controlling toaster, coffee machine)

Assignment 2.3: Project Idea

Group Work

Required
Reading

Introduction

Design
Processes

Linear Models

Iterative
Models

References

- Form groups of 3-6
- Describe product & process
- Product:
 - Develop the outline of a project idea which would implement such a system
 - Prepare a short pitch
- Process:
 - How would you manage development
 - How would you make sure your product is usable and can be implemented?
- Pitch your idea in the course

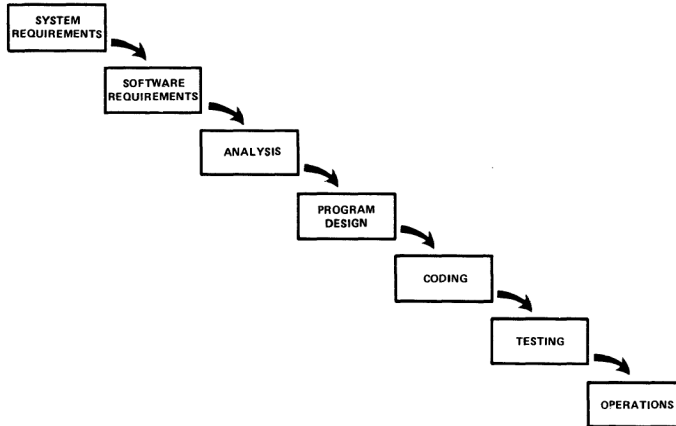

Linear Models

The Systems Engineering Process

According to Bahill and Gissing (1998)

Waterfall

Required
Reading

Introduction

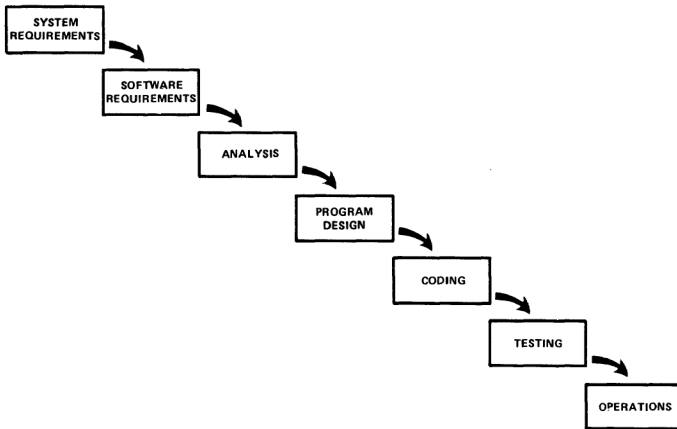

Design
Processes

Linear Models

Iterative
Models

References

Waterfall

“In my experience, ... the simpler model has never worked on large software development efforts ...” – Royce (1970)

Advantages and Disadvantages

Required
Reading

Introduction

Design
Processes

Linear Models

Iterative
Models

References

■ Advantages

- Clear demarcation of phases
- Easy planing and control
- Simple cost estimates

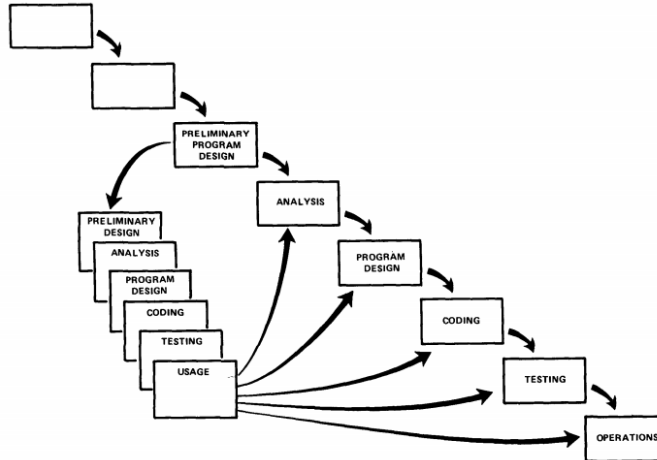

■ Disadvantages

- Does not scale
- Inflexible requirements
- Realization starts late
- Late discovery of faulty conceptualizations

- What is interesting is more the aspects than the structure
 - Analysis – Understanding the world
 - Concept – Designing a solution
 - Implementation – Realization of said solution
 - Evaluation – Test of said solution
- We will need to cover these aspects

Iterative Models

Waterfall – Do it twice

Royce (1970)

- Development processes are rarely as simple and straight as the linear models suggest
- Changes in requirements or requirements that are hard to formalize make the “waterfall” difficult to follow
- Worst case: develop a product removed from user requirements that will not be usable
- Software engineering has therefore developed different process models to counter these aspects
- Just a few examples
 - Spiral model
 - Unified process model (rational)
 - Agile Models
 - Feature driven development
 - Scrum

Iterative Models

Required
Reading

Introduction

Design
Processes

Linear Models

**Iterative
Models**

Analysis

Concept & Design

Implementation

Evaluation

References

- Iterative models paint s a much more realistic picture of development processes
- In real world settings, there will be phases where different sub tasks will be worked on independently
 - Producing media
- Later project phases will need a stronger relationship
- It is important to keep some aspects in mind
 - Different design activities can take a different amount of time and cannot easily be parallelized
 - Decision in some areas might be costly to revise later (music, video production)

Definition

A User-Centred Design Process

- is a method, that includes relevant human factors
- caters for conscious and accountable decisions
- helps set the focus on important questions and requirements
- supports evaluation and testing of assumptions

Process as well as product are based on goals, activities, tasks, capabilities, needs and context of users. Therefore, user participation plays a role early in the process. To be able to measure success, requirements need to be translated into quantifiable and measurable criteria

ISO Model

ISO Model

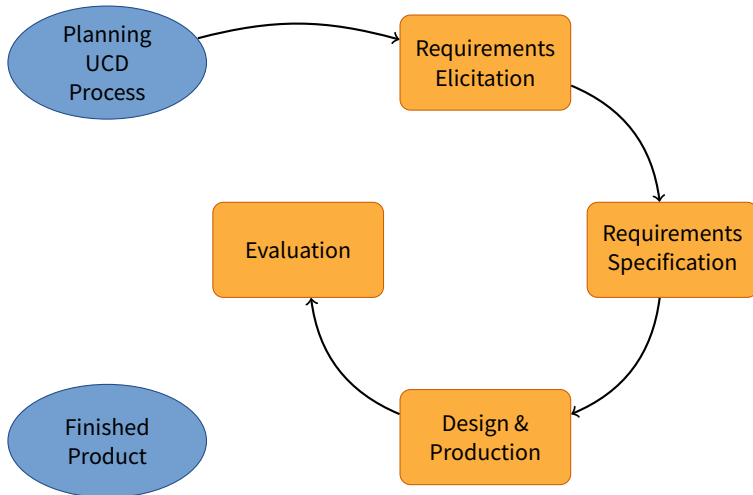

ISO Model

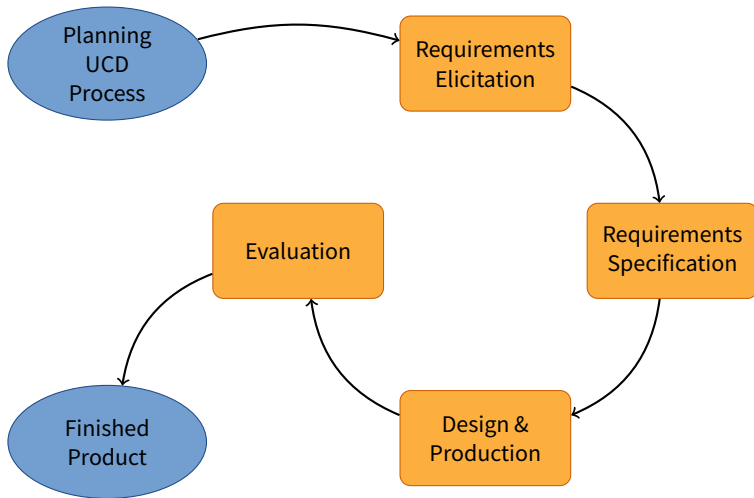

ISO Model

Definition

The official ISO 9241-11 definition of usability is: “the extent to which a product can be used by specified users to achieve specified goals with effectiveness, efficiency and satisfaction in a specified context of use.”

- It should be easy for the user to become familiar with and competent in using the user interface during the first contact
- It should be easy for users to achieve their objective through using the interface
- It should be easy to recall the user interface and how to use it on subsequent visits

Processes and Steps

- The ISO-Standard gives only a broad definition of human-centred processes
- A couple of different approaches can be classified as being instantiations of such an abstract definition
- We will often find the following aspects
 - Analysis (Requirements Elicitation)
 - Description of context
 - Description of user
 - Activity analysis
 - Artefact analysis
 - Concept (Requirements Specification)
 - Activity design
 - Information design
 - Interaction design
 - Prototypical Implementation (Design & Production)
 - Evaluation (Evaluation)

Assignment 2.4: Learning Support Systems

Introduction

Design
Processes

Linear Models

Iterative
Models

Analysis
Concept & Design
Implementation
Evaluation

References

- To begin with, we need to describe the context of use of the product
 - Production, safety-critical, entertainment
 - Market analysis – expectations of users
- Description of the spatio-temporal setting for using the system
 - Is it to be used outside? At what time?
- Description of the institutional context of use
 - for business software, how is it used in the business

- Description of the target audience of the system
 - Physical and cognitive abilities
 - Cultural and social factors
- Different methods available
 - User classes – the potential users of the system are categorized into different classes, using a range of criteria
 - Experts, casual users
 - Roles they have using the system
 - Personas – concrete, but fictitious description of person dealing with the system
 - Primary, secondary, negative

Task Analysis

Required
Reading

Introduction

Design
Processes

Linear Models

Iterative
Models

Analysis

Concept & Design

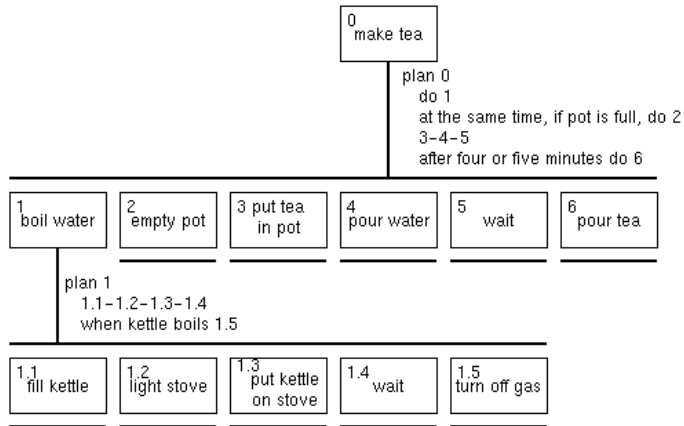

Implementation

Evaluation

References

- Different techniques can be used, such as interviews or ethnological studies
- First we need to know, how the users work today
 - And that is not how they (or their boss) thinks how they do it
- Individual activities, tasks and operations can be identified and e.g. hierarchically organized
- Different models exist, for example the Hierarchical Task Analysis (HTA)
- Example: In a bank, the tasks REVIEW-ACCOUNTS can be divided into:
 - RETRIEVE-ACCOUNT-LIST
 - FIND-RECENT-ACTIVITY
 - REVIEW-ACTIVE-ACCOUNTS

Hierarchische Aufgabenanalyse

👤 Nick Gibbins

Artefact Analysis

Required
Reading

Introduction

Design
Processes

Linear Models

Iterative
Models

Analysis
Concept & Design
Implementation
Evaluation

References

- Description of artefacts used
- What are the “things” that are being used? And how?
- What is an artefact? A culturally defined object.
 - Office furniture
 - Pens, staplers, hole punchers
 - Protocols
 - Forms
 - Files
 - Computer (Hard- and Software)

cc by-nc-sa Ian Lewis

Assignment 2.5: Artefacts

Discussion

- What artefact use do you notice?

Concept & Design

- First step: what activities are to be supported by the new system?
- Some process models have this as an explicit step (e.g. Scenario-Based Development)
- Challenges and opportunities of current situation are transformed into system behaviour
 - Keep opportunities and address challenges
- Goal: specification of what can be done with the system
 - What information is made available?
 - What operations are possible?
 - What kind of results is getting delivered?
- Activity design defines the opportunities, but the experience is constructed through the interface
- The activity design has to be transformed into a design that supports bi-directional interaction of human and computer

Information Design

- The **objects** and **actions** possible in a system are **represented** and **arranged** in a way that facilitates **perception** and **understanding**
- Includes the design of
 - Application screens
 - Web pages
 - Menus
 - Dialogs
 - Icons
- Other modalities
 - Sound
 - Speech synthesis
 - Tactile
 - Force feedback game controls
 - Visual
 - 3D-displays (geowall)
- Addresses the Gulf of Evaluation

- Goal: specify the mechanisms for accessing and manipulating task information
- **Information design** focuses on determining which task objects and actions to show and how to represent them
- **Interaction design** tries to make sure that people can **do the right things at the right time**
- Broad scope:
 - Selecting and opening a spreadsheet
 - Pressing and holding a mouse button while dragging it
 - Specifying a range of cells
- Addresses the Gulf of Execution

Implementation

Prototypical Implementation

- Instead of “Do it right the first time” we will develop iterative prototypes
- A prototype is a concrete but partial implementation of a system design
- Constructed and evaluated to guide redesign and refinement
- Created to explore many questions during system design
 - System reliability
 - Bandwidth consumption
 - Hardware compatibility
- User interface prototype
 - Built to explore usability issues
- User interface prototypes can be built early on in the design process
 - Paper prototype
- Late prototypes will probably be very close to the actual system (depending on process model)

Evaluation

Evaluation

Required
Reading

Introduction

Design
Processes

Linear Models

Iterative
Models

Analysis
Concept & Design
Implementation
Evaluation

References

- Necessary to assess progress and satisfaction of requirements
 - Formative and summative
- Helps understanding the activity and resulting requirements
- This leads to enhanced specifications and implementations
- Evaluation can start early in the process
 - Not only “finished” Software can be evaluated
 - Evaluation of User-Interface-Specifications
- Evaluations help to detect deficits in the design early on and to correct mistakes

Assignment 2.6: Evaluation and Analysis

Group Work
